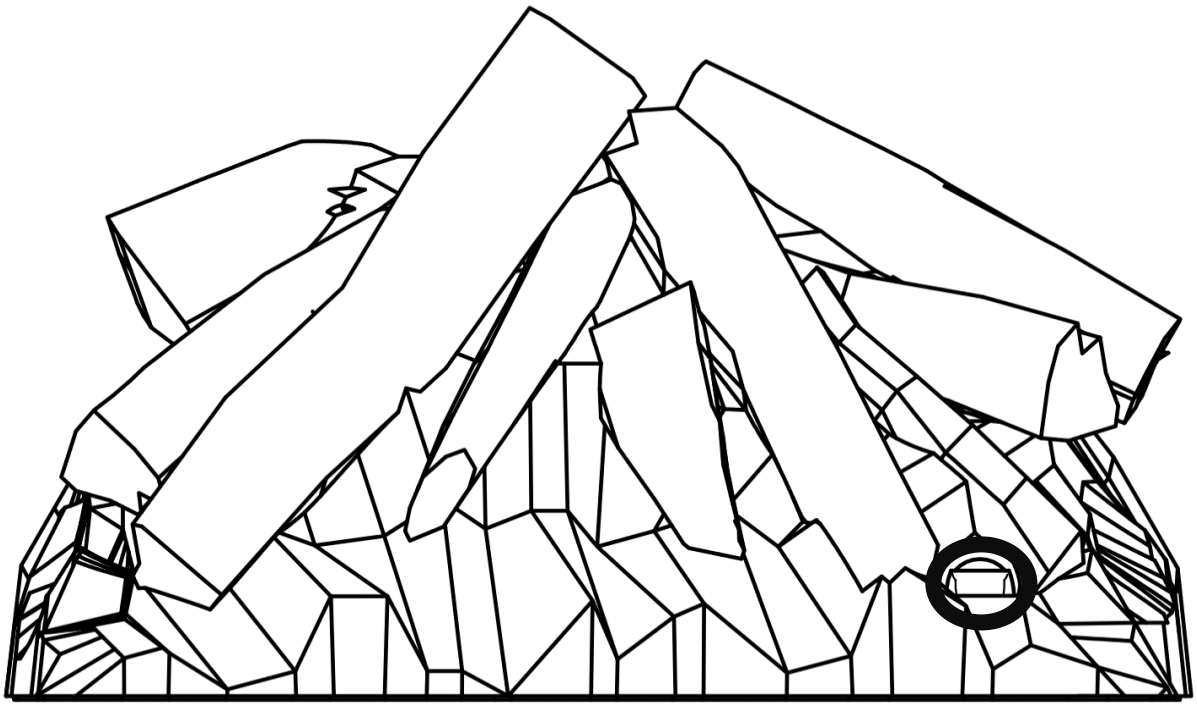
SLE25i Instructions

The SLE25i is designed to fit into your solid fuel burning stove and provide a warm light source.

Please clean any ash from your stove beforehand. Never put hot ash or embers in the bin, always wait for the fire to cool down before cleaning.

The SLE25i is powered by USB, this can be with the provided battery pack or any USB-C charging cable and USB adapter (not supplied).

The SLE25i can be turned on with the button on the front right on the fuel bed. This will illuminate the SLE25i for 8 hours before automatically turning off. Press a second time to turn off sooner.



Troubleshooting:

- If your SLE25i does not turn on, please check the battery is charged and your cable and USB ports are not damaged and plugged in to the SLE25i.
- This device is designed to use as little power as possible. As such it might be too little to "wake up" some USB batteries. Please test this SLE25i with a new battery by plugging it in and leaving the SLE25i off for 5 minutes for the battery to go in to "sleep mode" then pressing the power button on the SLE25i to wake the battery. The initial press may be enough to wakeup the battery, but not necessarily start the SLE25i, a second press may be required.
